

Press release n°2

Optimus, the worthy heiress of his big sister Primus

Standardized high performance thanks to innovative technology

Optimus thermoforming line

The different ranges of thermoforming machines and the models that compose them make it possible to meet the needs of all customers and increasingly specific problems.

When the Optimus reaches its limits, the Primus takes over.

This is how the excellent qualities of the Primus will meet the needs of high productivity with a rate of up to 20 cycles per minute and a thermoforming height allowing the packaging of a whole ham !

Its performance is the result of embedded technology, the Rapid Air System®, a very high-quality rapid forming technology regardless of the thickness of the film used. The Optimus benefits from the same on-board technology and their strengths are common :

- They are versatile in terms of packaging process : vacuum, sub-atmosphere, vacuum by steam sweeping and skin packaging. Everything is possible !
- Once started, they guarantee you a production in all serenity thanks to their stainless steel construction and their design. Only preventive maintenance is to be planned.
- Their modularity allows them to package all types of products by adjusting the settings : it is possible to choose the widths, the feed pitch, or even the thermoforming height (110 mm maximum for an Optimus and up to 190 mm for a Primus MP).
- The possible use of all types of films completes the multiplicity of combinations : flexible PA/PE films, semi-rigid APET/PE or RPET or PP films, paper-based films.

Do not hesitate to contact us to design the complete line adapted to your needs !

Application examples

Shrink packaging

Skin packaging

Variosteam (vacuum by steam sweeping)

Modified Atmosphere Packaging (MAP)
